- Electrostatic Sensitive Device
- 1. Unless noted otherwise, case temperature T_C = +25°C±2°C.
- 2. The center frequency, f_C , is measured at the minimum insertion loss point with the resonator in the 50 Ω test system.
- Frequency aging is the change in f_C with time and is specified at +65°C or less. Aging may exceed the specification for prolonged temperatures above +65°C. Typically, aging is greatest the first year after manufacture, decreasing in subsequent years.
- 4. Turnover temperature, T_0 , is the temperature of maximum (or turnover) frequency, f_0 . The nominal frequency at any case temperature, T_0 , may be calculated from: $f = f_0 [1 FTC (T_0 T_0)^2]$.
- 5. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance C₀ is the static capacitance between the two terminals measured at low frequency (10MHz) with a capacitance meter. The measurement includes case parasitic capacitance.
